

ABSTRACT OF THE DISCLOSURE

A massage device is composed of an elongated main body in the form of a sheet of flexible plastic material. The main body is configured with a plurality of flexible elongated strips extending from one end of the elongated body in cantilever fashion and juxtaposed spaced apart at their free ends to give the appearance of a hand with fingers splayed. The elongated strips define substantial contact areas, and an additional substantial contact area is defined at the other end of the main body. A vibration motor is fixed to the main body, which when operated imparts vibrations to the substantial contact areas via the main body to enable the device to perform a massage that simulates a hand massage.
